Abstract:
Infrared is light that cannot be seen with the naked eye. Infrared is located outside of the red part of the visible spectrum. Significantly different wavelengths in the visible light between 650 nm and 700 nm. While the infrared ray wavelength is 700 nm and 900 nm.
Termsuk infrared ray electromagnetic waves. Electromagnetic waves including a wave that has medn transferal magnetic and electric fields rambatnya direction perpendicular to each other.
Ease contained in the infra-red can not be seen naked eye, can penetrate the atmosphere, does not require a lot of stress and other causes are used for various industrial purposes, commercial and military.
