Abstract:
Internet technology is no longer a sentence that is foreign to people in the world of computers. Even for the layman though, those words the world wide web as if it had become an inseparable part of modern human life today. It is not unreasonable if current human agents tend to choose the web as a conduit of information. With the increasingly complex needs, no longer be easy to create a website interesting and informative is only by using HTML. But something more is needed so that user interaction can be used as the controlling information coming. Therefore, the author tries to discuss about the server-based programming Active Server Pages (ASP). ASP is a technology that allows developers to work on processes within the server.
For a discussion of the ASP, was selected for the bookstore application. Hence made a website about pemesananbuku bookstore featuring an online, catalog and guest book of the facilities offered by using Active Server Pages (ASP).
